SUMMARY

Computer science student interested in building useful, accessible web applications. I enjoy working across the frontend and backend, learning from feedback, and turning small ideas into dependable tools. I contribute carefully, communicate clearly, and grow through practical engineering work.

SKILLS

JavaScript, TypeScript, React, Next.js, Node.js, Express, PostgreSQL, MongoDB, Git, REST APIs, HTML, CSS, Jest

PROJECTS

CampusConnect - Student event planner
Built a responsive event board for 3 fictional student clubs to publish activities, manage registrations, and share timely updates.
- Created reusable React and TypeScript components for event discovery, filtering, and registration.
- Developed 12 REST endpoints with Node.js and Express to manage events and participant records.
- Integrated PostgreSQL data models and validation for event details, attendance limits, and registration status.

StudySpace - Collaborative study-room finder
Designed a small web app that helps students find study rooms, check availability, and coordinate group sessions.
- Implemented searchable room listings with filters for building, capacity, equipment, and available time.
- Integrated a Next.js interface with MongoDB-backed APIs for room details and saved preferences.
- Developed clear empty, loading, and error states, then tested key flows with Jest and peer feedback.

EDUCATION

Bachelor of Science in Computer Science
Example State University | Expected 2027
Relevant study: data structures, databases, web development, software engineering, and human-computer interaction.

ADDITIONAL

Use Git branches and pull requests for class projects. Document setup steps so teammates can run the application locally. Review changes with classmates, fix issues found during testing, and keep interfaces usable on mobile screens. Interested in accessible design, reliable APIs, and learning how production teams ship software. I also keep project notes concise, divide larger tasks into smaller steps, check forms with keyboard navigation, and ask teammates to try workflows before calling a feature complete. These fictional class projects were built for practice and have not been used by real organizations. I enjoy explaining technical decisions in plain language and making room for constructive feedback.
